

Prior to approval of BPL, FCC needs to ensure that credible, unbiased testing is performed to ensure that there will be no spectrum pollution to existing services. Equally important is to ensure that existing services do not cause interference to proposed BPL. I understand that similar proposals in Japan and Europe have been withdrawn by the power line carriers as a result of documented spectrum pollution between 2 MHz and 80 MHz. A premature approval of BPL could have devastating effects on our frequency spectrum and there is a need to proceed with great caution. Thank you for considering my comments.
